

Preface

The Intelligent Narrative Technologies workshop strives to be at the forefront of research on developing and examining intelligent and adaptive narrative systems.

As in previous years, this workshop brings together research from a variety of fields including cognitive modeling, artificial intelligence, natural language processing, and the humanities. The program this year incorporates a breadth of topics including character modeling, interactive and procedurally generated narratives, authoring tools, data mining applications, as well as narrative expression and analysis.

Supporting this diverse range of perspectives remains one of the Intelligent Narrative Technologies workshop's unique qualities. Through the exchange of techniques and ideas from a range of perspectives, we strive to promote an interdisciplinary dialog and advance the state of intelligent narratives.

–Marc Cavazza, Mei Si, and Alexander Zook
