ABSTRACT. Consumers' preference study allows industries to tailor the supply towards the preference of consumers so that market could be optimized for their turn-over and profits. This study investigated consumers' preference of fresh and smoked catfish in llorin Metropolis. A total of 225 questionnaires were administered adopting multi-stage techniques to elicit information from the respondents. The obtained data were subjected to descriptive and inferential statistics. The results showed that majority of the respondents in this study preferred smoked catfish irrespective of their socio-economic profile. The majority of the respondents agreed with the factors used in this study for the preference of fish (i.e. types) and their frequency of eating as their preferred fish. This study showed that only tribe of the respondents showed significant effect (p<0.05) on the respondents' preferences for whole or chunk fish; and family size, age and religion had significant effect on the frequency of their preferred fish.

KEYWORDS: catfish, preference; principal component analysis; consumption behavior; scree plot.

الملخص: إن دراسة ما يفضله المستهلكين، تسمح للقطاع الصناعي بإمداد السوق بالمنتجات التي يفضلونها حيث أن ذلك يساعد على تحسن السوق و زيادة الأرباح. ولذلك تم إجراء هذه الدراسة لمعرفة ما يفضله المستهلكين من سمك السلور سواء الطازج والمدخن في مدينة إليورين. حيث تم توزيع ٢٢٥ استبيان لإستخلاص المعلومات من عينة الدراسة. وقد خضعت البيانات التي تم الحصول عليها الى إحصاءات وصفية واستنتاجية. حيث أظهرت النتائج أن غالبية المشاركين في هذه الدراسة يفضلون سمك السلور المدخن بغض النظر عن وضعهم الاجتماعي و الاقتصادي. كذلك وافق غالبية المشاركين في هذه الدراسة المي المسوولة عن تفضيله من المراح معين من الاسماك وتكرار استهلاك تلك الاسماك. بالاضافة الى ذلك أظهرت هذه الدراسة أن القبيلة فقط لها تأثير كبير (p<0.05) على معن من الاسماك وتكرار استهلاك تلك الاسماك. والعمر والدين تأثير كبير على تن القبيلة فقط لها تأثير كبير (p<0.05) على تفضيل الأسماك كاملة أو كقطع كبيرة ؛ وكان لحجم الأسرة والعمر والدين تأثير كبير على تكرار استهلاك تلك الأسماك المهماك الموضلة لديهم.

الكلمات المفتاحية: سمك السلور ، التفضيل ، تحليل المكون الرئيسي ، سلوك المستهلكين ، التمثيل البياني.

## Introduction

he fisheries sector plays significant role in the economic development of many countries as it contributes to employment generation, income augmentation, addressing food and nutritional security concerns and foreign earnings (Sabater et al., 2008). Nigerians, on realization that there existed a wide gap between demand and supply of animal protein in the 1990s, invested heavily in fish production (Jimoh et al., 2013). Today Nigeria is a leading catfish producer in the Sub Saharan Africa. Catfish production in Nigeria represents more than half of the total production volume with an estimation of 13.3 kg annual per capita fish consumption in 2013 (FAO, 2017). In order to avoid wastage and economic loss, fresh catfish is hot smoked to keep its quality at a high level (Ayeloja et al., 2017). With increasing demand for fish as per capital income, and high prices of alternative sources of animal protein, there has been a shift to the consumption of fish. These are mostly

\*W. A. Jimoh ()) Department of Aquaculture and Fisheries, University of Ilorin, PMB 1515, Ilorin, Kwara State, Nigeria. email: jimoh.wa@unilorin.edu.ng in fresh and smoked forms. Due to the increase in aquaculture production and Nigeria's population, there is a need to study the consumers' preference and consumption pattern so that investors can determine the product that are preferred; thereby witnessing sustained fish demand.

In general, consumers' buying of any product largely depends upon their perception about the product (Kazmi, 2012). Hansen (2006) stated that consumer preferences for products differ depending on the nature of a product as well as the social and economic status of the consumer. Consumers purchasing decisions are determined by cultural, social, personal and psychological factors (Lautiainen, 2015). Solomon (2010) opined that a consumer's occupation, income level and purchasing power influences their purchasing decisions and buying behavior. Research into consumers' preference and behavior is necessary for the development of the consumers' products to secure sustained consumer demand and to maximize profit (Costa and Jongen, 2006). Various strategies are used in collecting information on consumers' behavior and preference on a product in order to witness sustained consumer demands of the products

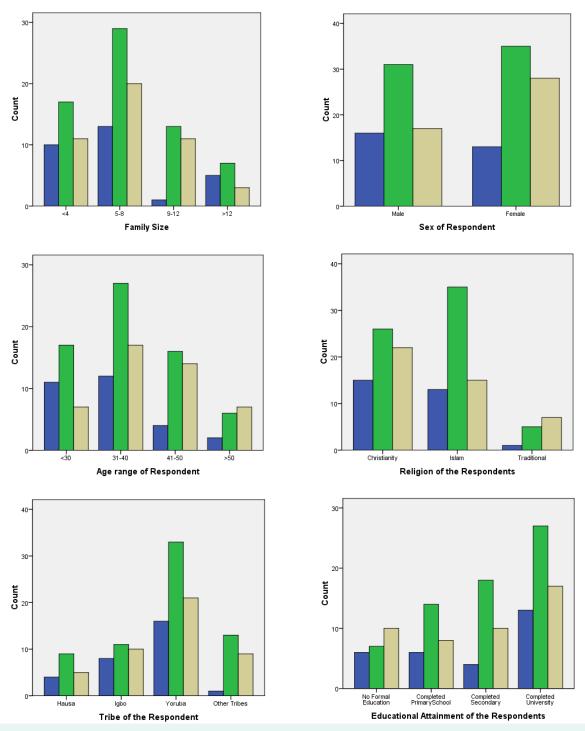

Figure 1. Socio-economic profile and their preference for part of chunk preferred (legends are shown in Figure 2)

(Nijssen and Lieshout, 1995). Information that affects consumers' preference and behavior for a particular product, such as demographic, sociocultural, socioeconomic information, are collected by the food industry to maintain their products competitive in the markets or to develop products that could satisfy the preference of the consumers (Stewart-Knox and Mitchell, 2003). Socio-cultural factors which include ethnic composition, education, and lifestyles have been reported to influence consumers' preference and buying pattern (Meulenberg and Viaene, 2005). Religious composition also plays influential role in consumers' preference (Solomon, 2010). Household size, age and gender distribution was also reported to have influence on the demand for a particular product (Hoek et al., 2004). The evaluation of consumers' preference for fresh and smoked-dried fish products can be used to prepare production planning and distribution of fish across the country (Adeniyi et al., 2012).

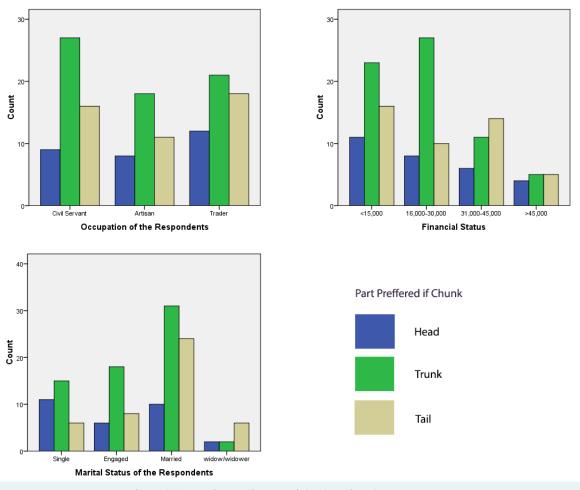

Figure 2. Socio-economic profile and their preference for part of chunk preferred

It gave a better understanding of the relationship that existed with the actual consumption or purchase (Honkanen et al., 2004; Olsen, 2004). The most closely studied relations in consumer economics is the association between personal preferences, consumption and demand curve (Myrland et al., 2000). Preference is considered to be the major factor influencing general food consumption behavior (Myrland et al., 2000). Fish consumption is mostly affected by tradition, and habit; it can be enhanced by nutritional awareness (Pieniak et al., 2008).

Although many researchers have studied consumers' preferences for fresh and smoke-dried catfish products (Jimoh et al., 2013; Sabater et al., 2008), there is a paucity of information on consumer's acceptability of fresh and smoked-dried catfish, thus this research was planned. This study therefore examined consumers' preference and behavior for fresh and smoked catfish sold within llorin, Nigeria.

## Materials and Methods

This study area was llorin the capital of Kwara state. It is located on latitude  $8^{\circ}30'N$  and longitude  $4^{\circ}35'E$ , in North Western Nigeria. llorin city has a population of

847,582 and it is a confluence of cultures, populated by Yoruba, Fulani and other tribes. Its town has about three local government areas including llorin east, llorin west and llorin south. The population comprises different fish mongers and consumers within llorin. Primary data were collected with the use of scheduled interview using structured questionnaire.

Primary data for this study were collected using multistage sampling techniques. The first stage involved the selection of three (3) wards under each of the three Local Government Areas selected using simple random technique, which gave a total of nine (9) wards. The second stage involved selection of five (5) communities under each ward using simple random technique, which gave a total of forty-five (45) communities. The third stage involved the selection of 5 respondents comprising of 2 fish mongers and 3 fish consumers from each community selected using simple random techniques, which resulted in a total of 225 respondents. However, the response rate was 88.9%, which resulted 200 respondents as the sample size.

The reliability of items in the questionnaire was measured using Cronbach's Alpha method of examining reliability. The Cronbach Alpha offered a measure of the internal consistency of a scale or test, expressed as number between 0 (completely unreliable test) and 1 (completely reliable test). An Alpha score above 0.75 is generally taken to indicate a scale of high reliability, 0.5 to 0.75 is generally accepted as indicating a moderately reliable scale, while a figure below this generally indicates a scale of low reliability.

## Data Analysis

The reliability of items in the questionnaire was measured using Cronbach's Alpha method of examining reliability. Scale statistics was done using a measure of central tendencies. The data collected were processed using both descriptive and inferential statistics. The descriptive analysis was mainly in terms of percentage and frequency of distribution to show the socio-economic profile of the respondents and factors that guide the respondents in their preference of fish in the study area. Bar charts were used to depict the socio-economic profile of the respondents and their preference for certain parts of fish or the other. Inferential statistics (chi-square statistics) were used to test the significance of the effect of some socio-economic profile of the respondents on their preference for the type or part of fish or the frequency of eating their preferred fish. Principal Component Analysis (PCA) was used to select variable of importance in the factors that guide the preference for certain types or part of fish and their frequency of eating (i.e. their preferred fish) using eigenvalue. The percentage of variance as indices after the data was subjected to Kaiser-Meyer-Olkin (KMO) measure as the sampling adequacy and Bartlett's test of sphericity. All the analysis were conducted using SPSS version 17 (SPSS, 2008).

## Results

### **Reliability Analysis of the Questionnaire**

The reliability value of items in the questionnaire was 0.645, indicating a moderate reliability (Table 1).

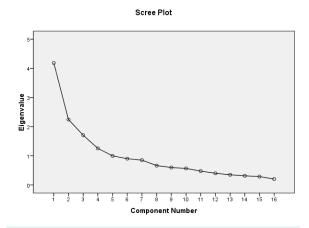

Figure 3. Scree plot showing the Eigen value of the studied variables

#### Socio-economic Profile of the Respondents

Personal information of the respondents using frequency counts and percentage are shown in Table 2. Respondent were almost equally distributed across genders with 50.5% of the respondents being male and 49.5% of the respondents being female; 43.5% fell within the age group 31-40 years as compared to 8% of the respondents fell within the age group of 50 years and above. The majority of the respondents practice Christianity and Islam (46%) as compared to 8% are traditional worshippers. The majority of the respondents (43%) were married while 5% were widow/widower. The majority of the respondents: 60.5% were Yoruba tribe, while Hausas had the lowest percentage (10%). Most of the respondents had formal education and only 11.5% of the respondents were not educated. Respondents (37 %) were civil servants, 33% were traders and 30% of the respondents were Artisans. Spending capacity of the responds were: 41% spent below №15,000, 33.5% spent ¥15,000 - ¥30,000 while 8% of the respondents spent above №45,000 on fish every month. Based on house hold size, this study showed that majority of the respondents 43.5% fell within the house hold size of 5-8 people, while 15% were 9-12 people, respectively.

Table 2. Socio economic profiles of the respondents

# Socio-economic Profile of the Respondents and their Preference for Fresh or Smoked Fish

Table 3 shows the cross tabulation (chi-square test of independence) of the demographic factors of the respondent against their preference for fresh or smoked fish. The socio-economic profile did not show significant effect (p>0.10) on the preference of respondents for fresh or smoked fish except religion.

# Socio-economic Profile of the Respondents and their Preference for Whole or Chunk Fish

Table 4 shows the cross tabulation (chi-square test of independence) of the demographic factors of the respondent against their preferred type of fish, either whole or chunk of fish. The table shows that only tribe of the respondents had significant effect (p<0.05) on the respondents' preference for whole or chunk fish, while other socio-economic profile had no significant effect (p>0.05) on the respondents' preference for whole or trunk fish.

## Socio-economic Profile and their Preference for Part of Chunk Preferred

The bar chart in the Figures 1 and 2 show that majority of the respondents with the family size regardless of sex, occupation or tribe of respondents preferred to eat the trunk part of fish. Also, respondents aged 50 or less prefer eating trunk fish although those above 50 years of age prefer to eat tail of fish. The bar chart also shows that the majority of the respondents practice Islam and

Table 6. Factors guiding preference for fish

D: Disagreed; SD: Strongly Disagreed; U: Undecided; A: Agreed; SA: Strongly Agreed SD: Standard Deviation ; CIE: Confidence Interval Estimate, \*\*\* Significant difference

Christianity, and they preferred eating the trunk part of fish. The traditionalists preferred the tail of fish except those who have no formal education whose majority prefer eating the tail of fish, the majority of educated respondents irrespective of their educational attainment preferred eating trunk of fish. The majority of the other socio-economic factors under this study preferred eating trunk of fish.

### Socio-economic Profile and Frequency of Eating Fish

Table 5 shows the cross tabulation (chi-square test of independents) of the social-economic profile of the respondents against the frequency of their preferred fish. It shows that family size, age and religion had significant effect on the frequency of eating fish.

#### Table 7. KMO and Bartlett's Test

Kaiser-Meyer-Olkin (KMO) Measure of Sampling Adequacy					
Approx. Chi-Square	1034				
DF	120				
Significant	0.000				
	Approx. Chi-Square DF				

# Factors Guiding Preference for Fish Consumption

Table 6 shows the factors guiding preference for fish consumption. The mean score on the 5-point likert scale for all the variables under consideration were above 2.5, which is the average of the 5-point likert scale. Majority of the respondents agreed with the studied variables as factors responsible for their preference of certain type or part of fish and their frequency of eating fish. The confidence interval estimated for all the studied variables were all very highly significant (p<0.0001).

### **Factor Analysis**

Table 7 shows the results of Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy and Bartlett's test of sphericity as conducted prior to PCA. The KMO test was 0.708 with Bartlett's Test of sphericity being significant (p<0.05). The Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO) was calculated using correlations and partial correlations to test whether the variables in our sample are adequate to correlate, it was calculated to identify whether variables were so highly correlated and cannot be distinguished between them (multicollinearity). A general rule of thumb is that a KMO value should be greater than 0.5 for a satisfactory factor. The higher the value is considered better. The KMO value in this study was 0.708, showing the data can be used for PCA. The results of the Bartlett's Test of Sphericity shows

Table 8. Communalities showing percentage of the variabili-<br/>ty in variables that is explained by the extracted factorsS/nVariablesInitialExtraction

S/n	Variables	Initial	Extraction
1.	Fish is highly nutritive	1.000	0.638
2.	It is less costly	1.000	0.683
3.	It is more delicious	1.000	0.637
4.	It has sweet aroma	1.000	0.534
5.	It is easy to cook	1.000	0.407
6.	Packaging	1.000	0.617
7.	Size of Fish	1.000	0.417
8.	Age	1.000	0.785

10.	Physical feature of fish	1.000	0.549
11.	Psycho-social issues	1.000	0.637
12.	Level of disposable incomes	1.000	0.472
13.	Fish size requirement	1.000	0.509
14.	Availability	1.000	0.520
15.	Family Background	1.000	0.608
16.	Cultural Background	1.000	0.619

whether there is a relationship between the variables. If no relationship is found then there is no point in proceeding with the factor analysis. A p-value less than 0.05 indicated that it was necessary to continue with the factor analysis. Since the p-value obtained in this study was significant (p < 0.001) it can be concluded that there were relationships between variables considered in this study, hence the data generated can be used for factor analysis.

# Extraction Method: Principal Component Analysis

Table 8 explains the percentage of the variability in the variables that is explained by the extracted factors. The results showed greater than 50% of the variation in each variable were explained by extracted factors except for variable 5 and 12 that were below 50%. Table 9 reveals that four components (or factors) have been produced with eigenvalues greater than 1 accounting for 58.71% of the variance in the data. If more than 5% variance is to be selected, then first 13 factors would be selected. The scree plot is presented in Figure 3.

## Discussion

The Cronbach's Alpha value obtained in this study depicted the items in the questionnaire to have moderate reliability as the total scores of the questionnaire. The respondents score was 77.54 (mean) with a variance of 99.25, and a standard deviation of 9.96. The small standard deviation indicated that variations in the scores of our respondents was small for the overall total score on the questionnaire, thus indicating moderate reliability of the questionnaire. Chi-square test of independence was used to show whether significant difference existed between the socio-economic profile of the respondent and the factors guiding their choice of catfish type and part. This test showed that there was no significant difference between the socio-economic profile of the respondents and their preference for smoked or fresh catfish except religion. This study showed that only tribe played significant role in the association between the socio-economic profile of the respondent and their choice for whole or chunk fish. Van Trijp and Steenkamp (2005) observed similar trend in their study of the influence of cultural factors on consumer buying behavior (i.e. a case study of pork). Sethi and Chawla (2014) also stated that tribal, social, cultural and psychological factors were some of the major factors that influenced the buying behavior of consumers. Tribe, culture, subculture and social class had profound influences on people's behavior because they were powerful drivers in the formation of attitudes, beliefs and values, this explained why certain consumption behavior was hard to change once developed (Blythe, 2008a, b). Socio-cultural factors have been reported to have impact on fish consumption preference (Myrland et al., 2000). The result of this study also indicated that religion also had a significant effect on the type of catfish preferred and frequency of consumption of their preferred fish. Religion was a major component of culture, it has strong influence on people's lives and behavior (Cwiertka, 2005; Kumar et al., 2008; Wandel et al., 2008). Ijewere and Odia (2012) and Lawan and Zanna (2013) opined that religion exerted the great influence on the thinking, perception and behavior of many people in the world. That was a key element of culture which influenced both behavior and purchasing decisions, it therefore influenced what to buy and in what form it should be bought. This study equally established that family size and age have significant association between socio-economic profile and the frequency of their consumption of preferred fish, while others had no significant association. Can et al. (2015) also observed that age group had significant influence on fish consumption preference among people leaving in Antakaya community in Turkey. Palash (2004) also observed that family size have significant influential role on consumption pattern and consumer behavior of fish in Dhaka city. Most of the respondents agreed with the variable listed as factor affecting consumers' preference on fresh and smoked fish. Kumar et al. (2008) reported that perceived quality of fish such as taste, health benefits, nutrition, price and availability are factors that could influence consumers' preference. Family size, age and religion had significant effect on the frequency of their preferred fish in this study. This was in consonance with the reports of Meulenberg and Viaene (2005) and Costa and Jongen (2006), as the size of families and households and demand for a food product. Also, Hoek et al. (2004) reported that demographic factors, such as household size and age could be used as indices of food preference and

demand. Greater percentage of our respondents are educated and readily agreed that level of education constituted one of the factor guiding their preference of fresh or smoked fish. They were the nutrition-conscious consumers. This study showed that respondents who had low level of educational did not consume as much fish as the respondents who were educated. The increased education level lead to produce and consume healthy food as educated consumers are nutrition-conscious (Brody and Lord, 2007; Kearney, 2010; Senauer et al. 1991).

## Conclusion

Fish consumption is influenced by many factors. These factors mainly determine the consumers' preference for fish. The present study indicated most of the respondents' preferred smoked catfish irrespective of their socio-economic profile. The majority of the respondents agreed with the studied variables (e.g. price, packaging, age) as the factors responsible for their preference of certain type or part of fish and their frequency of eating. This study showed that only tribe of the respondents had significant effect on the respondents' preference for whole or chunk fish. The family size, age and religion had significant effect on the frequency of their preferred fish. It is recommended that the consumers should be educated more on nutritional value of fish because this study showed that respondents who had low level educational attainment do not consume as much fish as the educated ones.
